DATASET OVERVIEW

This study analyzes global happiness data spanning from **2015 to 2019**.

The dataset includes key indicators such as:

- GDP per Capita
- Social Support
- Life Expectancy
- Freedom

Originally stored across multiple sheets, the data was **cleaned and consolidated into a single dataset** to enable efficient analysis.

INITIAL OBSERVATIONS

- The dataset spans multiple countries across 5 years
- Some inconsistencies existed in column names and values (e.g Taiwan and Taiwan Province of China)
- UAE has its 2018 corruption value missing and that was fixed using the average of the year before and the year after.
- Happiness levels vary significantly across regions.
- Years 2017 to 2019 did not have the region column at all and that was handled using a lookup method.
- Gambia only existed in one year (2019) and its region could not be looked up, so it was outsourced.

KEY QUESTIONS AND VISUAL INSIGHTS

Questions

- How has global happiness changed from 2015 to 2019?
- Which regions are the happiest?
- What factors (e.g., GDP) influence happiness?

Analysis shows that **global happiness levels remained relatively stable** over the five-year period. Regions such as **Australia & New Zealand** and **North America** consistently recorded **high happiness scores**. Minimal fluctuations suggest that **happiness patterns are relatively persistent over time**.

VISUAL INSIGHTS

Average Happiness Score by Region

Clear disparities exist across regions:

Australia & New Zealand recorded the **highest average happiness scores**

Sub-Saharan Africa consistently ranked as the **lowest**

This highlights significant **regional inequalities in well-being**

Comparison of Key Happiness Factors Across Regions

The analysis reveals strong relationships between happiness and key factors:

GDP per Capita: Higher economic prosperity is associated with higher happiness

Social Support: Strong social networks significantly improve well-being

Health (Life Expectancy): Better health outcomes contribute positively

Overall, happiness is influenced by a **combination of economic and social factors**

CONCLUSION & LIMITATIONS

Conclusion

This study demonstrates that:

- Happiness is strongly influenced by **economic, social, and health factors**
- **Regional differences** significantly impact overall well-being
- Improvements in both economic conditions and social systems can enhance happiness

Limitations

- Dataset limited to **2015–2019**
- Region classifications were **manually standardized**
- Some missing values required **estimation or external sourcing**.
